Large Sticky Traps for Capturing House Flies and Stable Flies in Dairy Calf Greenhouse Facilities. By Kaufman et al., page 176. Large sticky traps were evaluated for stable and house fly capture in dairy calf facilities. Fly management practices influenced trap captures. Stable fly populations, as reflected by trap capture, rose during the summer. Fly numbers on calves did not increase, however, suggesting that the traps greatly reduced potential stable fly pressure on the calves as the fly population increased. Estimated number of stable flies and house flies captured exceeded 142,000 and 900,000, respectively, during the 10-wk study. Producers were exceptionally pleased with the trap and most felt traps reduced flies to acceptable levels.
