Efficacy of Ovsynch Program on Reproductive Performance in Dairy Cattle: A Meta-Analysis. By Rabiee et al., page 2754. Meta-analysis was used to compare conception and pregnancy rates of Ovsynch, a timed AI and estrus synchrony program, with other breeding and synchrony programs in lactating dairy cows. Conception and pregnancy rates obtained with the Ovsynch program were comparable with other synchrony techniques, but varied among studies and with different programs. Ovsynch can benefit dairy operations because timed AI of lactating cows can be used, and the need for detection of estrus can be reduced or eliminated.
