Opinions and Practices of Wisconsin Dairy Producers About Biosecurity and Animal Well-Being. By Hoe and Ruegg, page 2297. Opinions and practices of Wisconsin dairy producers (n = 560) were characterized using a mailed survey. Herds were categorized into 4 herd-size strata. Most management practices were associated with herd size and probably reflected differences in facilities and resources. Biosecurity risks were prevalent, but large herds tended to adopt more biosecurity practices. Practices related to control of mastitis, Johne’s disease, and animal care were associated with herd size. Some opinions of producers were not in agreement with their practices. Producers from large herds appeared more knowledgeable about zoonotic risks associated with dairy farms.
