In Food Form, Some Probiotics Have a Better Chance to Promote Health **New Model to Evaluate Probiotic Survival in the Gut Described in the *Journal of Dairy Science***

Amsterdam, February 22, 2012 – Functional foods containing bacteria with beneficial health effects, or probiotics, have long been consumed in Northern Europe and are becoming increasingly popular elsewhere. To be of benefit, however, the bacteria have to survive in the very hostile environment of the digestive tract. A group of scientists from the Norwegian University of Life Sciences in Ås, Norway have developed a “model gastric system” for evaluating the survival of bacteria strains in the human digestive system, and determined that some bacteria strains survive better when consumed as fermented milks. Their results are published in the February issue of the *Journal of Dairy Science*.

“Most of the bacterial strains we tested have interesting functional properties related to food products. We wanted to evaluate whether these strains could contribute with beneficial health functions, or even have the potential as probiotics for human consumption,” explains lead investigator Professor Siv Skeie of the Department of Chemistry, Biotechnology, and Food Sciences.

Researchers tested 5 *Lactococcus* bacteria strains, including 4 *Lc. lactis* ssp. *cremoris* strains, which are found in ropy milks, traditional Nordic fermented milk products reported to have beneficial effects on consumer health, as well as 3 *Lactobacillus* strains, and one strain of *Enterococcus hirae*. The study tested whether the strains could survive exposure to acidic conditions and bile salts, the traditional method of evaluating the potential of probiotic bacteria. The bacteria were also subjected to a process that mimicked the human digestive system, incubating the bacteria in human gastric and duodenal juices at body temperature. The bacterial strains were tested both as pure cells from cultured media and in the form of fermented milk.

The initial in vitro testing in acid and bile salts found that *Lactobacillus* strains had a significantly higher acid tolerance than the lactococci strains and *E. hirae*. The model digestion experiments allowed researchers to simulate with more precision the multiple stress factors that might ultimately affect the

survival and subsequent performance of bacteria in the gut. The lactobacilli strains showed the highest survival rate in the model digestive system, whereas the cocci, with some exceptions, performed similarly in both systems. Interestingly, while none of the lactococcal stains and the *E. hirae* strain survived in significant numbers after exposure to the gastric juices, their numbers increased in the subsequent duodenal phase.

“This could mean that lactococci and enterococci are able to resurrect their viability if they are exposed to more suitable conditions like those in the small intestine. This is very interesting because it is in the intestine that functional or probiotic bacteria confer their health benefit to the host,” suggests Dr. Skeie.

In testing whether fermented milk gave protection to the bacteria through the digestive tract, the results were mixed. The *Lactococcus* strains Af-1 and ML-8 and *Lb. paracasei* INF448 showed lower numbers of viable cells compared with the digestion of pure bacterial cells. The other strains showed higher numbers of viable cells in comparison. In particular, the fermented milk improved the viability of the *Lactococcus* strains Ar-1, Bf-2, the active bacteria in ropy milk, and *E. hirae* INF E1 during incubation under gastric conditions.

“These results seem to confirm that foods, such as fermented milks, could be a protective matrix enhancing survival of some bacteria,” Dr. Skeie concludes.

The article is "Survival of Lactic Acid Bacteria from Fermented Milks in an In Vitro Digestion Model Exploring Sequential Incubation in Human Gastric and Duodenum Juice," by T. Faye, A. Tamburello, G.E. Vegarud, and S. Skeie. *Journal of Dairy Science*, Volume 99, Issue 2 (February 2012), DOI 10:3168/jds.2011-4705, published by Elsevier.

NOTES FOR EDITORS

Full text of the article is available to credentialed journalists upon request. Contact Verity Kerkhoff at +31-20-485-3310 or jdsmedia@elsevier.com to obtain copies. Journalists wishing to set up interviews with the authors should contact Siv Skeie at +47 64965844 (office), +47 97189324 (mobile), siv.skeie@umb.no or Gerd Vegarud at +47 64966176, gerd.vegarud@umb.no.

ABOUT THE JOURNAL OF DAIRY SCIENCE® (JDS)

The official journal of the American Dairy Science Association®, *Journal of Dairy Science*® (JDS) is the leading general dairy research journal in the world. JDS readers represent education, industry, and government agencies in more than 70 countries with interests in biochemistry, breeding, economics, engineering, environment, food science, genetics, microbiology, nutrition, pathology, physiology, processing, public health, quality assurance, and sanitation. JDS has been ranked number 3 in the Agriculture, Dairy and Animal Science category of the Journal Citation Reports® 2010, published by Thomson Reuters, with an Impact Factor of 2.463. www.journalofdairyscience.org

ABOUT THE AMERICAN DAIRY SCIENCE ASSOCIATION® (ADSA)

The American Dairy Science Association® (ADSA) is an international organization of educators, scientists and industry representatives who are committed to advancing the dairy industry and keenly aware of the vital role the dairy sciences play in fulfilling the economic, nutritive, and health requirements of the world's population. It provides leadership in scientific and technical support to sustain and grow the global dairy industry through generation, dissemination, and exchange of information and services. Together, ADSA

members have discovered new methods and technologies that have revolutionized the dairy industry.

ABOUT ELSEVIER

Elsevier is a world-leading provider of scientific, technical and medical information products and services. The company works in partnership with the global science and health communities to publish more than 2,000 journals, including *The Lancet* (www.thelancet.com) and *Cell* (www.cell.com), and close to 20,000 book titles, including major reference works from Mosby and Saunders. Elsevier's online solutions include SciVerse ScienceDirect (www.sciencedirect.com), SciVerse Scopus (www.scopus.com), Reaxys (www.reaxys.com), MD Consult (www.mdconsult.com) and Nursing Consult (www.nursingconsult.com), which enhance the productivity of science and health professionals, and the SciVal suite (www.scival.com) and MEDai's Pinpoint Review (www.medai.com), which help research and health care institutions deliver better outcomes more cost-effectively.

A global business headquartered in Amsterdam, Elsevier (www.elsevier.com) employs 7,000 people worldwide. The company is part of Reed Elsevier Group PLC (www.reedelsevier.com), a world-leading publisher and information provider, which is jointly owned by Reed Elsevier PLC and Reed Elsevier NV. The ticker symbols are REN (Euronext Amsterdam), REL (London Stock Exchange), RUK and ENL (New York Stock Exchange).
